**Abstract.** During the recent years, several surveys were conducted by the Kuban State University, All-Russian Institute of Plant Protection, Institute of Cytology and Genetics SB RAS (Novosibirsk), and Zoological Museum of Moscow State University in the North-Western Caucasus and on the adjacent territories, mainly in the Russian Republic of Adygea and Krasnodar Krai. In all, 102 Dolichopodidae species were collected and identified, including *Dolichopus calinotus* Loew, 1871, *Lamprochromus kowarzi* Negrobov et Tshalaja, 1988, *Medetera parenti* Stackelberg, 1925, *Nematoproctus distendens* (Meigen, 1824), *Neurigona pallida* (Fallén, 1823), *Poecilobothrus annulitarsis* Kazerani, Pollet, Khaghaninia, 2017, *Sciapus albifrons* (Meigen, 1830), *Sybistroma discipes* (Germar, 1821), and *Thrypticus bellus* Loew, 1869 new for the Krasnodar Krai; *Dolichopus salicitorum* Loew, 1871 and *Medetera petrophila* Kowarz, 1877 new for Adygea; and *Rhaphium antennatum* (Carlier, 1835) new for Rostov Oblast. *Argyra atriceps* Loew, 1857, *Dolichopus strigipes* Verrall, 1875, *Gymnopternus silvestris* (Pollet, 1991), *Medetera lamprostomoides* (?) Negrobov, 1972, *Nematoproctus praesectus* Loew, 1869, and *Rhaphium nasutum* (Fallén, 1823) are found in the Caucasus and Krasnodar Krai for the first time, while *Poecilobothrus basilicus* (Loew, 1869) and *Medetera media* Parent, 1925 are the first reports for Russia. The former Mongolian endemic *Dolichopus brunneilineatus* Negrobov, 1976 was unexpectedly revealed in the Krasnodar Krai near Novorossiysk. *Campsicnemus armeniacus* Negrobov et al., 2017 was placed in synonymy with *Campsicnemus varipes* Loew, 1859. *Campsicnemus simplicissimus* sensu Parent (1938) was found to be different from *C. simplicissimus* (Strobl, 1906). Most of the collected species are widespread across southern band of the Palaearctic Region.

**Аннотация.** В последние годы было организовано несколько экспедиций Кубанским государственным университетом, ВНИИ защиты растений, Институтом цитологии и генетики СО РАН и Зоологическим музеем МГУ на Северо-Западном Кавказе и сопредельных территориях, в основном в Республике Адыгея и Краснодарском крае. Всего идентифицированы 102 вида Dolichopodidae, в том числе восемь видов, новых для Краснодарского края, два — для Адыгеи, один — для Ростовской области. Шесть видов обнаружены в Краснодарском крае и на Кавказе в целом впервые, а *Poecilobothrus basilicus* (Loew, 1869) и *Medetera media* Parent, 1925 впервые указаны для России. Монгольский эндемик *Dolichopus brunneilineatus* Negrobov, 1976 неожиданно пойман в Краснодарском крае около Новороссийска. *Campsicnemus armeniacus* Negrobov et al., 2017 сведен в синонимы к *Campsicnemus varipes* Loew, 1859. Большинство собранных видов широко распространены в южной полосе Палеарктики.

*Neurigona verrichterae* Negrobov Fursov, 1988, described from Krasnodar Krai, was synonymized with *Neurigona suturalis* (Fallén, 1823) (Grichanov 2010). Negrobov and Grichanov excluded European *Sciapus frater* Parent, 1927 and *S. spiniger* (Zetterstedt, 1859) from the Caucasus (Negrobov, Grichanov 2010a). Grichanov and Nourtí excluded the Atlantic European *Teuchophorus bipilosus* Becker, 1908 from the Caucasus (Grichanov, Nourtí 2021). Negrobov (Negrobov 2010) raised from synonymy *Medetera armeniaca* Negrobov, 1972, *M. meridionalis* Negrobov, 1967 and *M. petrophiloides* Parent, 1925, inhabiting the Caucasus.

This paper presents new records for 102 species arranged alphabetically by genus, resulting mainly from the recent Russian expeditions organized by the Kuban State

## Introduction

The Dolichopodidae fauna of the Caucasus and East Mediterranean Basin as a whole was reviewed by Grichanov (Grichanov 2007) and included more than 500 species. Grichanov et al. (Grichanov et al. 2009) published the last list of Dolichopodidae species from Adygea containing 95 species. The North-Western Caucasus comprised more than 220 species of long-legged flies at that time, i.e., the largest recorded dolichopodid fauna in the Caucasian region. Long-legged flies collected from this part of the Caucasus were later extensively investigated by different researchers. Thus, new records were published from the Krasnodar Krai (Maslova et al. 2007; 2008; 2011; 2020; Negrobov et al. 2007; 2016; 2017a; Grichanov 2008; 2012a; 2012b; 2022; Negrobov, Kornev 2010; Negrobov, Grichanov 2010a; Grichanov, Negrobov 2014; Kustov et al. 2016; Grichanov, Nourtí 2021; Selivanova et al. 2012), from the Rostov Region (Grichanov 2012a), from the Russian Republic of Adygea (Maslova et al. 2007; 2008; 2011; 2019; 2020; Negrobov, Nechai 2009;

University (Krasnodar), All-Russian Institute of Plant Protection (Saint Petersburg), Institute of Cytology and Genetics SB RAS (Novosibirsk), and Zoological Museum of Moscow State University (Moscow). They were collected mainly in the Russian Republic of Adygea and Krasnodar Krai. Material of the newly-recorded species will be housed in those institutions. Information on world distribution for each species listed follows Grichanov (Grichanov 2024). Most specimens (except as noted) were dried and mounted on pins and placed in the museum drawers.

### New Records

#### 1. *Argyra argyria* (Meigen, 1824)

**Material examined.** 2♂, Krasnodar Krai, env. of Krasnodar, Krasnyi Kut forest park, 44°58'32" N, 39°01'12" E, 19 m, 22.05.2016, V. Gladun.

**Distribution.** Caucasus: Azerbaijan, Russia (Adygea, Krasnodar). West Palaearctic species.

#### 2. *Argyra atriceps* Loew, 1857

**Material examined.** 1♂, Krasnodar Krai, Goryachy Klyuch distr., env. of Oktyabrsky vill., Mokryi Sepsil River, 29.05.2013, S. Kustov, V. Gladun.

**Distribution.** Europe. New for the Caucasus and Krasnodar Krai.

#### 3. *Argyra diaphana* (Fabricius, 1775)

**Distribution.** Type locality: Spain, Algeciras. Caucasus: Abkhazia, Russia (Karachay-Cherkessia, Krasnodar, Rostov). Bulgaria, France, Greece, Hungary, Iran, Italy, Israel, Morocco, Russia (Astrakhan), Spain, Switzerland, Tajikistan, Turkey.

**Differential diagnosis and notes.** *Campsicnemus simplicissimus* differs from males of other Palaearctic species of the genus by simple legs without remarkable

setation. It differs from other species with simple male legs in such characters as black antenna, absence of velvety black spots on mesonotum and parallel wing veins  $R_{4+5}$  and  $M_{1+2}$ . The species was originally described from southern Spain (Algeciras) without distinct diagnostic characters and illustrations (Strobl 1906). It was later described only once and was never figured. Parent (Parent 1938) described *C. simplicissimus* from a male collected from a locality near the French Alps (Lyonnais), giving no illustrations, and added such unusual characters as the ratio of cross-vein dm-m to distal part of  $M_4$  (2/3), three pairs of dorsocentrals, two prothoracic setae and absence of acrostichals. This male was somewhat smaller than Strobl's male (1.5 vs. 2 mm) and may belong to a different species.

The senior author has re-examined males collected from Rostov Oblast, Krasnodar Krai (Russia), Abkhazia, Turkey (Side province; figured), Iran (West Azerbaijan and Sistan and Baluchistan provinces) and Tajikistan (in all, 32 males from 17 localities). They are slightly variable in body size and leg colour, but have no significant

differences in leg and body setation, wing veins and podomeres length ratios from a male on the photo provided by Dr. M. Nourtia (Université Abdelmalek Essaâdi, Tétouan, Morocco). This male collected from the northernmost Moroccan region Rif and other material examined correspond with the description of *C. simplicissimus* by Strobl.

The following morphometric characters (in mm) were not included into original description of *C. simplicissimus* (based on a male from the Mediterranean province of Turkey). Body length 1.8 mm, antenna length 0.6 mm, wing length 2.4 mm, wing width 0.8 mm; clypeus as long as wide, nearly 1/3 length of face; antennal postpedicel 1.5 times as long as high; length of scape, pedicel, postpedicel, arista-like stylus, 0.08/0.05/0.12/0.4; thorax with 4 pairs of strong dorsocentral bristles; acrostichals small, uniserial anteriorly, irregularly biserial posteriorly; short sparse prothoracic hairs above and below; one strong prothoracic bristle above coxa; femur, tibia and tarsomere (from first to fifth) length (mm): fore leg: 0.68 /0.58/0.36/0.19/0.15/0.11/0.11, mid leg: 0.78/0.87/0.38/0.21/0.17/0.11/0.10, hind leg: 0.87/1.02/0.27/0.3/0.2/0.14/0.12; length of part of costa between  $R_{2+3}$  and  $R_{4+5}$  and this between  $R_{4+5}$  and  $M_{1+2}$ , 0.36/0.22; length of cross-vein dm-m and distal part of  $M_4$ , 0.19/0.36.

Modified couplet in the key to Palaearctic species of *Campsicnemus* (males) published by Grichanov (Grichanov 2009):

5. Legs entirely simple, without elongated hairs on tarsi or femora; legs mostly yellow ..... 5a
- Legs with elongated hairs on fore tarsus or hind femur or on mid femur and tibia; legs variously coloured ..... 6
- 5a. Wing vein dm-m 1/2, usually 2/5 as long as distal section of  $M_4$ ; 4 pairs of dorsocentrals; acrostichals present; 1.5–2 mm ..... *C. simplicissimus* Strobl
- Wing vein dm-m 2/3 as long as distal section of  $M_4$ ; 3 pairs of dorsocentrals, acrostichals absent; 1.5 mm ..... *C. simplicissimus* sensu Parent.

**Notes.** *Campsicnemus varipes* is a rare, but widespread species described from Austria 'bei Wien' and known from Europe, the Caucasus, Turkey, and Middle Asia. The description and illustrations of *C. armeniacus* (Negrobov et al. 2017b) has no differences from the *C. varipes* species concept (Becker 1918; Parent 1938; Grichanov 2009). At present, we consider *C. armeniacus* as a junior synonym of *C. varipes*.

### Acknowledgements

The authors express their sincere gratitude to our colleagues: Prof. Semyon Kustov and Dr. Vladimir Gladun (Krasnodar), Dr. Nikita Vikhrev (Moscow) and Dr. Oleg Kosterin (Novosibirsk), who provided us with their materials, to Mr. Andrey Koloskov, deputy Minister of Natural Resources of the Krasnodar Krai for support in the research. Dr. Mohamed Nourti (Tétouan, Morocco) kindly sent us photos of *Campsicnemus simplicissimus*. Drs. Nikita Vikhrev (Moscow) and Igor Shamshev (Saint Petersburg) kindly commented on the earlier draft of the manuscript.

### Funding

This work was supported by the All-Russian Institute of Plant Protection, research project No. FGOU-2022-0002.
